WEEKLY LOG:

This week, my partner and I have made significant progress on our social media application by developing a simple login, signup, and forgot password interface. Our focus has been on implementing the graphical user interface (GUI) using Scene Builder, with each option being assigned to separate classes and corresponding .fxml files. The key features of our current implementation are as follows:

- **Login Page:**

This page includes a logo for our app, accompanied by a text field for entering the username and a password field. Additionally, there are two buttons for navigating to the signup and forgot password pages.

- **Signup Page:**

Upon clicking the signup button on the login page, users are directed to the signup page. Here, we have included four text fields for the username, email, contact number, and a password hint. Additionally, there are two password fields: one for the password and another for confirming it to ensure user data integrity.

- **Forgot Password Page:**

When users click on the "forgot password" button on the login page, they are taken to the forgot password page, where a single text field prompts them to enter the hint provided during account creation.

Next week, we plan to develop the homepage, which will contain all the main features of our application.
